

Dear ambassador,

This is a very important message for you and your country. By virtue of my profession and also as a hobbyist I've been experimenting on rats and other mammals for years. One day I made the following experiment: I injected a rat, which had never been given the drug X, with blood of rats already addicted to the drug X. The rat in question is the laboratory rat, thus the albino form (*Rattus norvegicus*).

The result was the following: The rat fell into coma (apoplectium) and died within a few minutes.

I repeated the experiment with several rats; no rat stayed alive.

Later when I injected the drug X in the same quantity as it occurred in the blood of the dead rats, to a second group of rats which also had never been brought into contact with the drug, nothing happened. Apparently the blood of the addicted rats contained a substance (produced by themselves) which is mortal to non-addicted rats. When you aren't well-informed of the above, cerebral hemorrhage (apoplexia cerebri) would be concluded as cause of death. I've made the same experiments on cats and dogs with equal results.

After years of research I was able to insulate the active substance which is produced by the addicted animals (without them dying of it). This substance already turned out to be mortal in very small quantities when the animals had inhaled or were injected with it. (The animals at stake are non-addicted animals). The strange thing is that the substance can't be recovered in the cadaver, that is to say it doesn't leave traces in the blood or in the organs of some kind.

I hope you understand the importance of this discovery. The perfect murder without proof is now possible. I wrote this letter to a great number of ambassys. It is my target to make money out of this discovery. So I sell the chemical formula of the active substance and a detailed description of my experiments.

If you are interested in more information you can contact me as it is written in the addition.

In Eindhoven in the dutch province Brabant there is a busstop station just before the railway station.

The local busses are numbered from A till Z.

When you are interested in more information you have to put the number 3-1870 with white chalk on a tile of

busstop <sup>g</sup> you have to do this before 17-6-20.

I hope we can do business.
